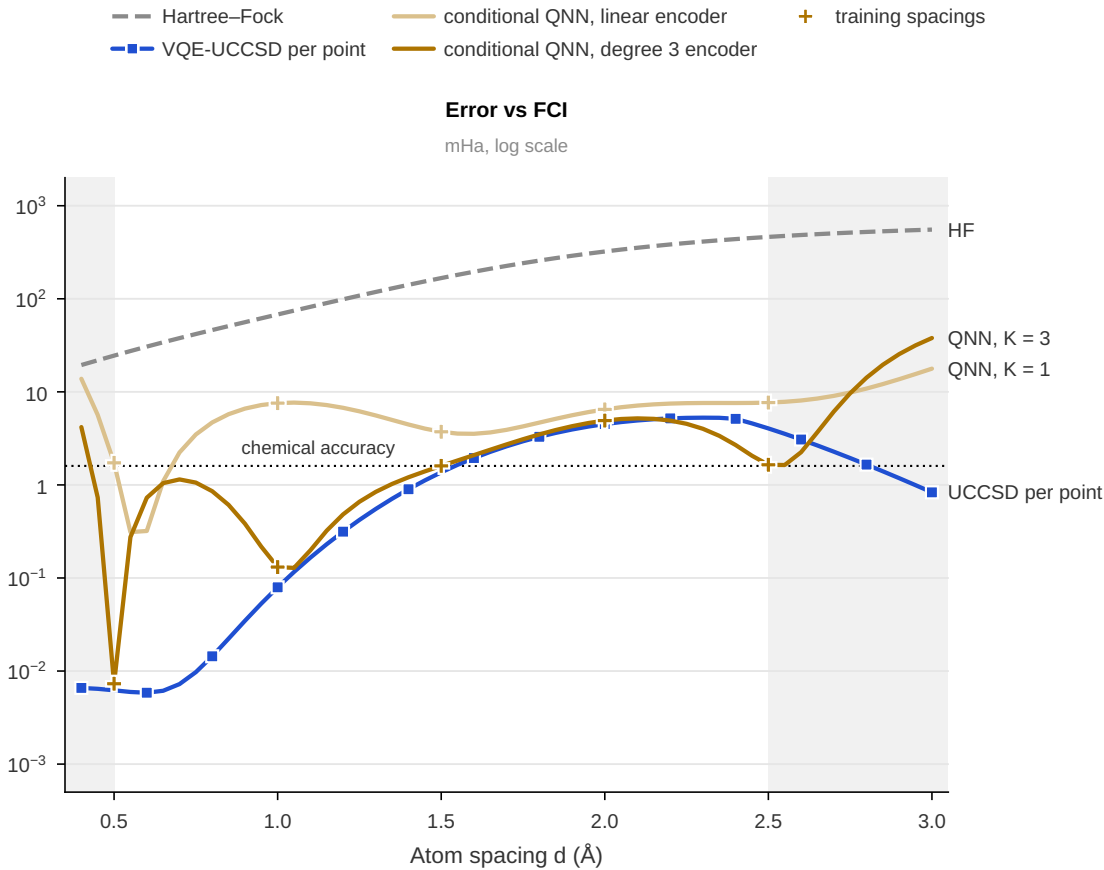
Error along the H_4 chain: one conditional QNN vs UCCSD trained at every spacing



H_4 chain, STO-3G, noiseless statevector, UCCSD circuit (26 angles). Conditional QNN: angles from a Chebyshev encoder of d, trained on the mean energy of 5 spacings (no FCI labels), K = encoder degree; line = median of 5 initialisations, band = all 5. UCCSD per point: best of 3 starts. Gray: outside the training range. Errors below 10^{-3} mHa are drawn at the floor.
