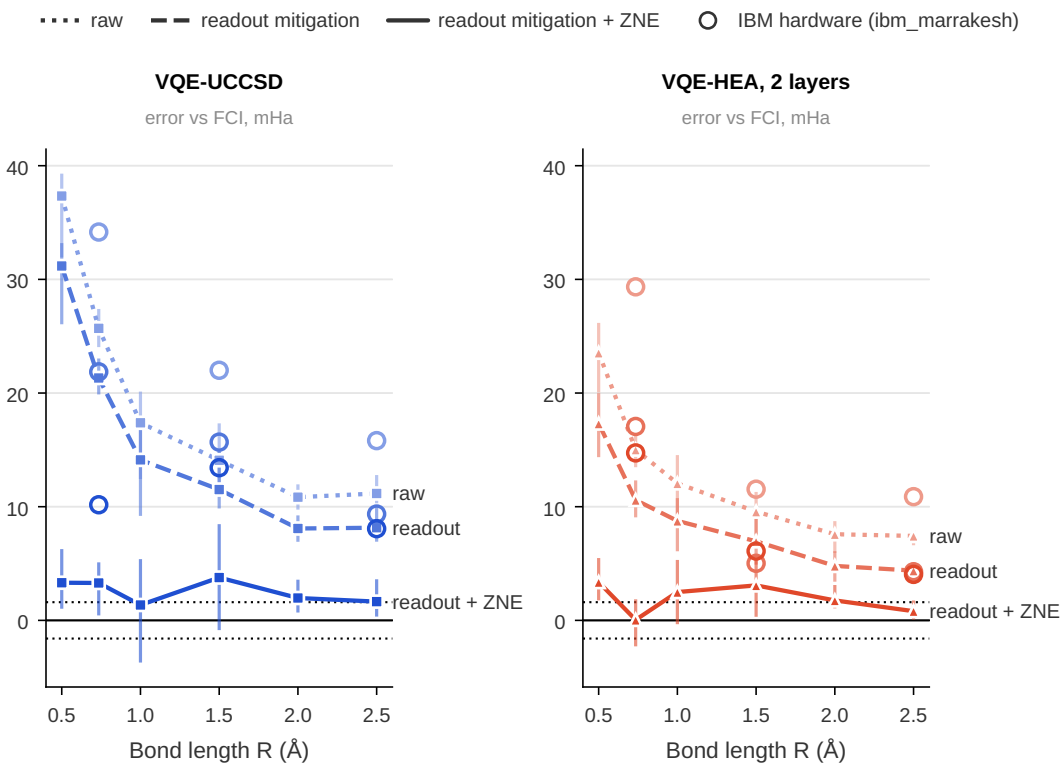
Energy error of trained H_2 circuits on a noisy IBM processor, with and without error mitigation



H_2, STO-3G, 2 qubits. Noisy simulator of IBM Fez (calibration noise model), 16384 shots per circuit, lines: mean of 5 shot seeds, bars: all 5. ZNE: two-qubit gates folded ×1, ×3, ×5, linear fit to zero noise. Dotted: chemical accuracy, ±1.6 mHa.
